

Assignment#1 Simple Moon Rover.

Make sure you have read through all the introductory material before you begin this assignment.

Our first assignment will be to give the Robot a simple list of instructions to get it to navigate a pre-determined path.

While your robot *won't* be making any decisions, the assignment will get you to practice using the RobotC interface and your Robot's hardware.

Imagine you are on a team of engineers who have been given the task of programming a Moon Rover. Your mission is to have the robot make its way through a trench that has been discovered on the moon.

At the end of the trench there will be an alien you must destroy.

Marking:

10 marks

- Mission Completed?
- Code handed in with correct programming standards?
